

## EG3111 Finite Element Analysis and Design

### Exercise sheet #2: Energy method for elasticity

#### Question

Solve the problem of a vertical hanging bar deforming elastically under its own weight using the method of elastic energy minimisation with the following quadratic shape function.

$$u(x) = a \left( \frac{x}{L} \right) + b \left( \frac{x}{L} \right)^2$$

where  $a$  and  $b$  are the degrees of freedom (DOF) to be determined.
